PROFESSIONAL SUMMARY

Computer Science graduate (3.89 GPA) with production experience building and automating cloud software pipelines on AWS, with a strong foundation in Python, C/C++, and SQL. Proven ability to own complex engineering problems end-to-end, collaborate across teams, and deliver iterative, tested solutions in agile environments.

EDUCATION

Ohio University | Athens, OH May 2026

Bachelor of Science in Computer Science | GPA: 3.89 | Cybersecurity Management Certificate | Dean's List — 8 Semesters

TECHNICAL SKILLS

Languages & Frameworks: Python, C/C++, Java, SQL, Bash, JavaScript, Tensorflow, Verilog

Platforms & Tools: AWS (Lambda, SageMaker, S3, DynamoDB), Docker, Git, CI/CD pipelines

EXPERIENCE

SkyCop | Memphis, TN

August 2025 – May 2026

Software Engineering Intern

- Built a fully automated cloud software pipeline on AWS (Lambda, S3, DynamoDB, Python/boto3), driving feature implementation through analysis, design, and iterative delivery for a production computer vision system.
- Automated build, test, and deploy processes via a CI/CD-style pipeline with integrated performance benchmarking and zero-downtime endpoint redeployment, embedding testing automation directly into the delivery workflow.
- Collaborated across infrastructure and ML teams to architect and iteratively redeploy a multi-model SageMaker inference system, achieving **90%+ license plate recognition accuracy** in production.

Ohio University | Athens, OH

May 2024 – August 2024

Computer Hardware Security Research Intern

- Rapidly onboarded to four new hardware design tools (PyMTL3, OpTiMSoC, VectorCGRAs, Vivado) to investigate a published CVE, demonstrating curiosity and adaptability in unfamiliar technical environments.
- Independently scoped and implemented a secure cache solution using CGRAs, owning the problem end-to-end from root-cause analysis through validation and preventing cache timing attacks in production.

PROJECTS

Cancer Detection Predictor Model May 2024

- Designed and implemented a full ML software project in Python (pandas, NumPy, scikit-learn), engineering features from raw datasets and training a Random Forest classifier evaluated via cross-validation, confusion matrices, and ROC-AUC metrics.
- Optimized compute-intensive pipeline routines by compiling Python to C extensions (Cython), significantly reducing runtime on large-scale datasets and demonstrating depth across high-level and systems-level programming.

LEADERSHIP & MEMBERSHIPS

Association for Computing Machinery (ACM) | Athens, OH

August 2022 – Present

Member

- Strengthened software problem-solving skills and collaborative engineering practices through ACM-sponsored coding challenges, competitive programming events, and cross-functional team exercises.
